Description	<p style="text-align: center;">Interannual variability of carbon fluxes (scaled)</p> <div style="display: flex; justify-content: space-around;"> <div style="text-align: center;"> <p>CABLE-POP</p>  </div> <div style="text-align: center;"> <p>JSBACH</p>  </div> </div> <div style="display: flex; justify-content: space-around; margin-top: 10px;"> <div style="text-align: center;"> <p>OCN</p>  </div> <div style="text-align: center;"> <p>SDGVM</p>  </div> </div> <p>To reproduce the variability of atmospheric CO<sub>2</sub>, an estimation of the terrestrial carbon sink is needed. One of the most reliable reproductions of the terrestrial carbon cycles is the TRENDY model ensemble. This product results from the carbon fluxes of 18 land surface models (LMs) forced with meteorological observations. However, there is high uncertainty in the spatial patterns of carbon flux variability (See figure). This means that the LMs disagree on how much individual regions contribute to the variations in atmospheric CO<sub>2</sub>. By establishing measures for regional model performance, a weighted averaging scheme can be applied. The aims of this thesis are to a) quantify the differences in the interannual variability of carbon fluxes of the TRENDY LMs, b) calculating one or more observation-based performance metrics, and c) to perform the model weighted in order to find out whether the performance metrics are suitable to improve the reproduction of atmospheric CO<sub>2</sub>.</p>
